- Nash-Williams, 1960 :
 - \triangleright G is 2k-edge connected \iff G admits a k-arc-connected orientation.

- Nash-Williams, 1960 :
 - ▶ *G* is 2k-edge connected \iff *G* admits a k-arc-connected orientation.
- Ito et al., 2023:
 - Algorithmic proof of Nash-Williams, by flipping one edge at a time.
 - Exhibiting a sequence of orientations such that :
 - The arc-connectivity does not decrease, and the arc-connectivity of the last element of the sequence is k.
 - The next orientation in the sequence can be obtained from the previous one by flipping exactly one edge.
 - The sequence can be obtained in polynomial time (in the size of the directed graph).

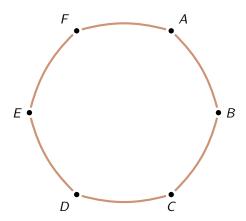

- Nash-Williams, 1960 :
 - ▶ *G* is 2k-edge connected \iff *G* admits a k-arc-connected orientation.
- Ito et al., 2023:
 - Algorithmic proof of Nash-Williams, by flipping one edge at a time.
 - Exhibiting a sequence of orientations such that :
 - The arc-connectivity does not decrease, and the arc-connectivity of the last element of the sequence is k.
 - The next orientation in the sequence can be obtained from the previous one by flipping exactly one edge.
 - The sequence can be obtained in polynomial time (in the size of the directed graph).

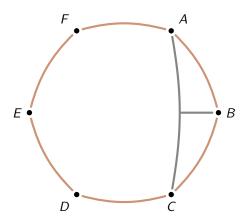

Goal of the article: Expanding the result of **Ito et al.** to hypergraphs.

 - The sequence can be obtained in polynomial time (in the size of the directed graph).

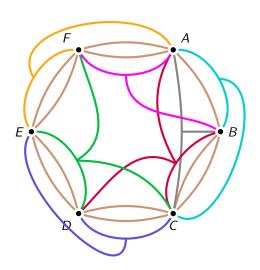

Goal of the article: Expanding the result of Ito et al. to hypergraphs.

Side note: This article generalise the results of **Ito et al.**, as directed graphs are special case of hypergraphs.

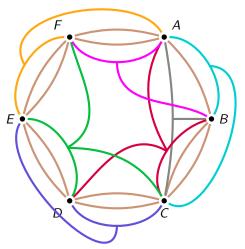

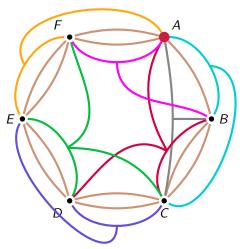

Degree of $\emptyset \neq X \subsetneq V$

 $d_{\mathcal{H}}(X)$ is the number of hyperedges intersecting both X and $V \setminus X$.

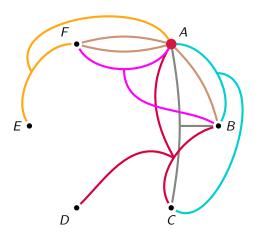

Degree of $\emptyset \neq X \subsetneq V$

 $d_{\mathcal{H}}(X)$ is the number of hyperedges intersecting both X and $V \setminus X$.

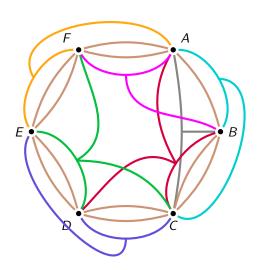

Degree of $\emptyset \neq X \subsetneq V$

 $d_{\mathcal{H}}(X)$ is the number of hyperedges intersecting both X and $V \setminus X$.

Orientation of an hypergraph

Orientation of an hypergraph

In-Degree of $\emptyset \neq X \subsetneq V$

 $d_{\mathcal{H}}^-(X)$ is the number of hyperarcs (Y, v) such that $: v \in X$, $\exists u \in Y \setminus X$.

In-Degree of $\emptyset \neq X \subsetneq V$

 $d_{\mathcal{H}}^-(X)$ is the number of hyperarcs (Y, v) such that $: v \in X$, $\exists u \in Y \setminus X$.

In-Degree of $\emptyset \neq X \subsetneq V$

 $d_{\mathcal{H}}^-(\mathsf{X})$ is the number of hyperarcs (Y, v) such that : $v \in \mathsf{X}$, $\exists u \in \mathsf{Y} \setminus \mathsf{X}$.

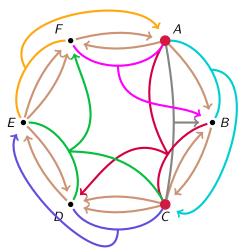

Out-Degree of $\emptyset \neq X \subsetneq V$

 $d_{\mathcal{H}}^+(\mathsf{X})$ is the number of hyperarcs (Y, v) such that $v \not\in \mathsf{X}$ and $\exists u \in \mathsf{Y} \cap \mathsf{X}$.

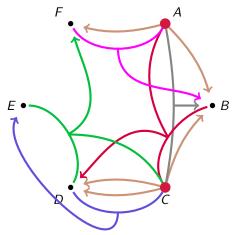

Out-Degree of $\emptyset \neq X \subsetneq V$

 $d_{\mathcal{H}}^+(\mathsf{X})$ is the number of hyperarcs (Y, v) such that $v \not\in \mathsf{X}$ and $\exists u \in \mathsf{Y} \cap \mathsf{X}$.

Out-Degree of $\emptyset \neq X \subsetneq V$

 $d^+_{\mathcal{H}}(\mathsf{X})$ is the number of hyperarcs (Y, v) such that $v \not\in \mathsf{X}$ and $\exists u \in \mathsf{Y} \cap \mathsf{X}$.

- $\vec{\mathcal{H}}$ is k-hyperarc-connected, if, $\forall e \in \mathcal{E}$, $d^+_{\vec{\mathcal{H}}}(e) \geq k$.
- The hyperarc-connectivity of a graph, denoted $\lambda(\vec{\mathcal{H}})$, is the maximum value of k such that $\vec{\mathcal{H}}$ is k-hyperarc-connected.

- $\vec{\mathcal{H}}$ is k-hyperarc-connected, if, $\forall e \in \mathcal{E}$, $d^+_{\vec{\mathcal{H}}}(e) \geq k$.
- The hyperarc-connectivity of a graph, denoted $\lambda(\vec{\mathcal{H}})$, is the maximum value of k such that $\vec{\mathcal{H}}$ is k-hyperarc-connected.
- The previous orientation given was 2-hyperarc-connected.

- $\vec{\mathcal{H}}$ is k-hyperarc-connected, if, $\forall e \in \mathcal{E}$, $d^+_{\vec{\mathcal{H}}}(e) \geq k$.
- The hyperarc-connectivity of a graph, denoted $\lambda(\vec{\mathcal{H}})$, is the maximum value of k such that $\vec{\mathcal{H}}$ is k-hyperarc-connected.
- The previous orientation given was 2-hyperarc-connected. There is a 3-hyperarc-connected orientation

- $\vec{\mathcal{H}}$ is k-hyperarc-connected, if, $\forall e \in \mathcal{E}$, $d^+_{\vec{\mathcal{H}}}(e) \geq k$.
- The hyperarc-connectivity of a graph, denoted $\lambda(\vec{\mathcal{H}})$, is the maximum value of k such that $\vec{\mathcal{H}}$ is k-hyperarc-connected.
- The previous orientation given was 2-hyperarc-connected.
- ullet Let ${\mathcal P}$ be a partition of V :
- ullet $e_{\mathcal{H}}(\mathcal{P})$ is the number of hyperedges intersecting at least 2 elements of \mathcal{P}

- ullet is k-hyperarc-connected, if, $orall e \in \mathcal{E}$, $d^+_{ec{\mathcal{H}}}(e) \geq k$.
- The hyperarc-connectivity of a graph, denoted $\lambda(\vec{\mathcal{H}})$, is the maximum value of k such that $\vec{\mathcal{H}}$ is k-hyperarc-connected.
- The previous orientation given was 2-hyperarc-connected.
- ullet Let ${\mathcal P}$ be a partition of V :
- ullet $e_{\mathcal{H}}(\mathcal{P})$ is the number of hyperedges intersecting at least 2 elements of \mathcal{P}
- \mathcal{H} is (k, k)-partition-connected, if :
 - $ightharpoonup \forall \mathcal{P}, e_{\mathcal{H}}(\mathcal{P}) \geq k \times |\mathcal{P}|$

- ullet is k-hyperarc-connected, if, $orall e \in \mathcal{E}$, $d^+_{ec{\mathcal{H}}}(e) \geq k$.
- The hyperarc-connectivity of a graph, denoted $\lambda(\vec{\mathcal{H}})$, is the maximum value of k such that $\vec{\mathcal{H}}$ is k-hyperarc-connected.
- The previous orientation given was 2-hyperarc-connected.
- ullet Let ${\mathcal P}$ be a partition of V :
- ullet $e_{\mathcal{H}}(\mathcal{P})$ is the number of hyperedges intersecting at least 2 elements of \mathcal{P}
- \mathcal{H} is (k, k)-partition-connected, if :
 - $\forall \mathcal{P}, e_{\mathcal{H}}(\mathcal{P}) \geq k \times |\mathcal{P}|$

We use a result of Frank : \mathcal{H} is (k, k)-partition-connected if and only if it admits a k-hyperarc-connected orientation.

Main result

Main result (Theorem 7)

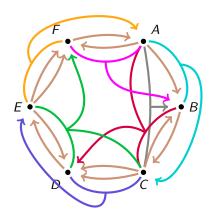

Let $\mathcal{H}=(V,E)$ be a (k+1,k+1)-partition-connected hypergraph and $\vec{\mathcal{H}}$ is a k-hyperarc orientation of \mathcal{H} . Then there exists a sequence of hyperarcs $(\vec{\mathcal{H}}_i)_{i\in 0...\ell}$ such that $\vec{\mathcal{H}}_{i+1}$ is obtained from $\vec{\mathcal{H}}_i$ by reorienting exactly one hyperarc and $\lambda(\vec{\mathcal{H}}_{i+1}) \geq \lambda(\vec{\mathcal{H}}_i)$ and $\lambda(\vec{\mathcal{H}}_\ell) = k+1$. Such a sequence of orientations can be obtained with $\ell \leq |V|^3$ and found in polynomial time (in the size of \mathcal{H}).

Main result

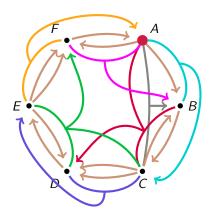

Main result (Theorem 7)

Let $\mathcal{H}=(V,E)$ be a (k+1,k+1)-partition-connected hypergraph and $\vec{\mathcal{H}}$ is a k-hyperarc orientation of \mathcal{H} . Then there exists a sequence of hyperarcs $(\vec{\mathcal{H}}_i)_{i\in 0...\ell}$ such that $\vec{\mathcal{H}}_{i+1}$ is obtained from $\vec{\mathcal{H}}_i$ by reorienting exactly one hyperarc and $\lambda(\vec{\mathcal{H}}_{i+1}) \geq \lambda(\vec{\mathcal{H}}_i)$ and $\lambda(\vec{\mathcal{H}}_\ell) = k+1$. Such a sequence of orientations can be obtained with $\ell \leq |V|^3$ and found in polynomial time (in the size of \mathcal{H}).

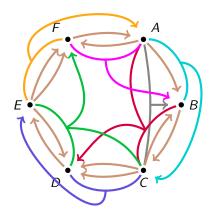

Generalization of **Ito et al.**, as digraphs are special cases of hypergraphs.

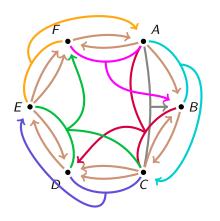

- Take r in $V(\mathcal{H})$.
- ② Compute sets of vertices.
- Stopping Criteria
- Select a set R (cf. 2.)
- Find an admissible (s, t)-hyperpath in R to reorient
- Reorient the corresponding hyperpath.
- **o** Goto (2.)

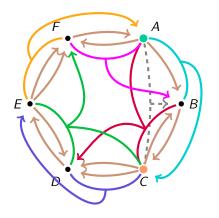

- Take r in $V(\mathcal{H})$.

 - After reorientation of P, there is a set whose cardinality is a guarantee that the algorithm will stop.

What are safe sources and safe sinks?

A brief detour...

Remainder of the algorithm :

- Input : A k-hyperarc-connected orientation of a (k+1, k+1)-partition-connected hypergraph.
- Output : A k + 1-hyperarc-connected hypergraph.
